ABSTRACT

Subtitle files is more known as .srt files for those who watch movie using computer. This files is quite unique because it does not need any third-party software to be utilize and easy to use. Thus, it is very common for people to type srt.files on the search box of a browser. However, it is very hard to find the exact .srt files that aligned with length of movie. Many movie will be vary in length depending on its sources, and this variation affect the possibility of .srt files to be useless. This is because .srt files is only designed for specific length of movie. If the movie length is greater or lower than the .srt files, the flow of subtitle will interrupted. Plus, it is hard to find .srt.files for Bahasa Malaysia. If there is srt.files for Bahasa Melayu, user from Malaysia need to prepare because the .srt files will be typically in Bahasa Indonesia. Furthermore, there is also issue with wrong translation. Thus, to solve these issue a project called the .SRT Request System is proposed. This is how the system will work, a user will upload his/her video to the system and he/she must wait for the .srt files to be produce. The result will be given depending the length of the movie. This is the main weakness of this system, user need to be patient. However, the result will be great with proper alignment, no wrong translation and in the right language. There is no such system existed yet where user can request .srt file for their video clip. The other benefit is that the system will free to use, no adds, no registration and it is charity-based. Plus, user can also request .srt files for any video clip and not limited to movie clip only or in any format such as .mp4 and .avi files. However, the system will not accept 18SX clip or any clip that contain nudity. The system still accept other 18 rated clip such horror movie or violent movie. For starting, the system is only capable in creating .srt files in Bahasa Malaysia and English. For future development, the system will soon able to create .srt files in many languages

Keywords: srt files, charity, free to use, request system, subtitle.
